1 O 2.1.1 2.4.7 Important page functionality was found to be not operable via keyboard only, involving focusable elements in the original sub-menus that were not reachable and did not have discernible visible focus. For purposes of a more logical structure and content better reflecting user needs, the main menus previously reflecting the parent organization (Utah Olympic Legacy Foundation) were revised to reflect components for the venue (Utah Olympic Oval) only along with a new separate link to the free-standing Foundation website. The previous sub-menus employed in the original site design (for the various venues underneath the Foundation) have been dispensed with in these wireframes; these components thus no longer need to be reachable.

2 O 2.4.4 Descriptive names or context explaining the purpose of each link are not provided for all links (e.g. the social media icons at the top of the page). Descriptive names or context for all such links must be provided so that users with visual and/or cognitive disabilities can navigate more easily and fully understand what each link will do.

3 R 4.1.2 Components like the social media icons and the Utah Olympic Legacy Foundation logo in the footer do not have discernible text, thus not meeting the criteria that all user interface components (e.g., links, buttons, form fields, etc.) need to provide programmatically determinable information about their name and role. Ensure that all these user interface components provide programmatically determinable information about their name and role. This can be achieved by using descriptive text or ARIA labels to provide a clear name and semantic HTML or ARIA roles to define the purpose of elements.

4 P 1.4.3 Purchase Ticket CTA needs to have a contrast ratio of 4.5:1 or greater to achieve desired contrast ratio. Current white (#FFFFFF) on orange (#FFA433) is insufficient (contrast ratio of only 1.97:1)

5 P 1.4.1 1.4.3 Links or buttons that use color alone to indicate changes in state need to use means other than just color to convey meaning. So, any such buttons or links that merely change color upon hover must have another visual cue added, such as underlines, bold or italics, or other focus indicators (like visible focus outlines). Additionally, the color used for state of change must have a contrast ratio of 4.5:1 or greater to achieve WCAG minimum contrast ratio.

6 P 1.1.1 Alternative text (alt text) must be incorporated into the site code for all non-text content in order to help people who have difficulty perceiving visual content.
